

MASTER UI DESIGN SYSTEM

Sonthillu Constructions

A reusable visual and UX standard for future web applications, portals, dashboards and customer-facing products.

Design direction

Premium • Modern • Clean • Soft-glass •
Real-estate focused

Brand character

Trust • Family • Construction • Stability •
Premium value

Primary reference: the supplied dashboard image establishes the target UI language: pale blue surfaces, rounded cards, compact navigation, soft depth, strong information hierarchy, clean charts and premium spacing.

1. Design Vision

The interface should feel like a premium real-estate operating product rather than a generic admin template. It must combine the visual calm of a modern SaaS dashboard with the trust and warmth of the Sonthillu Constructions brand.

Core principles

- Premium simplicity: fewer visual elements, stronger hierarchy, no unnecessary decoration.
- Soft depth: use pale blue surfaces, subtle borders, restrained shadows and rounded containers.
- Brand-first: navy and gold should identify the company; gold is an accent, not a dominant background.
- Information clarity: users should understand status, value, action and next step within seconds.
- Consistent rhythm: use one spacing system and repeat component geometry across every page.
- Responsive by design: desktop, tablet and mobile layouts must be intentionally designed, not merely scaled.

Visual personality

Keywords: sophisticated, airy, trustworthy, modern, structured, family-oriented, premium, technology-enabled.

2. Brand Visual Language

The logo establishes a two-color identity: deep architectural navy and warm construction gold. The UI should translate these colors into a restrained product palette.

	Primary Navy #203B73		Brand Gold #E0B040		App Background #F4FAFC
	Deep Navy #172A52		Action Blue #4268E8		Card Surface #EAF3F8
	Primary Text #172033		Muted Text #667085		Border #D7E3EA

Color rules

- Navy = navigation, headings, key identity, selected states and important structural elements.
- Gold = brand highlights, premium indicators, badges, secondary emphasis and occasional primary brand actions.
- Action blue = interactive controls, active tabs, charts and data-selection states where stronger contrast is required.
- Pale blue = page background and large surfaces. It should create the soft, airy feeling visible in the reference.
- White = content clarity. Use white cards selectively against pale-blue surfaces rather than making the entire UI pure white.

3. Typography, Spacing & Shape

Typography must be clean and highly legible. Use a modern sans-serif family such as Inter, Manrope, Plus Jakarta Sans or an equivalent. The exact font can change by project, but the hierarchy must remain consistent.

Level	Recommended	Usage
Display	32–40 px / 700	Hero/dashboard headline
Page title	24–28 px / 700	Primary page heading
Section	16–20 px / 650	Card and section headings
Body	14–16 px / 400–500	Main information
Caption	12–13 px / 400–500	Metadata, timestamps, helper text

Spacing system

- Base spacing: 4 px. Preferred rhythm: 8 / 12 / 16 / 20 / 24 / 32 / 40 px.
- Desktop page padding: approximately 32 px; compact screens: 16–20 px.
- Card internal padding: 20–24 px for primary cards; 16 px for compact cards.
- Border radius: 14–20 px for cards; 10–12 px for inputs and small controls; pill shape for status/filter chips.
- Avoid excessive rounded elements. Every radius should communicate grouping or interaction.

4. Layout Architecture

The reference dashboard uses a persistent left navigation, a compact top utility bar and a modular content canvas. Reuse this structure when it fits the product; do not force it onto pages where a simpler layout is more appropriate.

Desktop shell

- Left sidebar: 240–260 px. Logo at top, primary navigation in the middle, support/settings/account actions at the bottom.
- Top bar: global search, quick actions, notifications, language if required, profile/account menu.
- Main canvas: responsive 12-column grid with 20–24 px gutters.
- Right rail: only when it adds contextual value, such as recent listings, alerts, tasks or recommendations.
- Cards: modular blocks with consistent title, action, content and footer patterns.

Navigation behavior

- Active navigation item uses a high-contrast filled/soft-highlight state and a clear icon.
- Never rely on color alone to communicate the active state.
- Collapse sidebar to icon-only at medium widths; use a drawer on mobile.
- Keep navigation labels short and action-oriented.

5. Reference Composition

The supplied screenshot should be treated as the visual benchmark for composition, density and hierarchy—not as a page that must be copied literally.

What to preserve from the reference: left navigation hierarchy, airy blue canvas, rounded information cards, compact utility bar, strong KPI cards, data visualization with restrained colors, property/listing cards and a clean lower data table.

6. Component Design Rules

Component	Design rule
Buttons	Primary actions should be solid navy or brand gold depending on context. Secondary actions use soft surfaces/borders. Use one clear primary CTA per visual region.
Cards	Use 14–20 px radius, subtle border, very soft shadow only where elevation is needed. Avoid heavy gradients.
Inputs	Minimum 44 px interaction height. Clear label, placeholder, focus state, error state and helper text. Never depend on placeholder text as the label.
Status chips	Compact pills for Paid, Pending, Approved, Rejected, In Progress etc. Pair color with text/icon.
Charts	Simple bars, lines and donut charts. Keep gridlines subtle. Highlight one important series; do not overload the chart.
Tables	Use generous row height, clear column hierarchy, sticky headers for long datasets and responsive conversion to cards on mobile.
Property cards	Large image, price/value, location, essential specs and status/action. Image ratio should remain consistent.
Modals / drawers	Use for focused actions. Keep them short; multi-step operations should use a dedicated page or stepper.
Notifications	Group by priority and recency. Use clear unread indicators and direct actions.

7. Interaction & UX Standards

- Feedback: every important action needs visible confirmation, loading, success and error states.
- Hover: use subtle elevation, border or surface change. Avoid dramatic animations.
- Motion: 150–250 ms micro-interactions; use motion to explain state changes, not decorate.
- Loading: skeleton loaders should preserve the final layout and prevent content jumping.
- Empty states: explain what is missing and provide one relevant next action.
- Error states: describe what happened, why when useful, and how the user can recover.
- Confirmation: destructive actions require confirmation and clearly identify the consequence.
- Accessibility: keyboard navigation, visible focus, semantic structure, readable contrast and minimum touch target around 44 px.

Responsive rules

Desktop	12-column layout, persistent sidebar, multi-column dashboard, optional right rail.
Tablet	8-column layout, collapsed sidebar, 2-column cards where possible.
Mobile	4-column layout, drawer/bottom navigation, stacked cards, horizontally scrollable filters, tables converted to cards.

8. Do / Don't

DO	DON'T
Use pale blue as the main canvas and white/soft cards for content.	Use a fully saturated blue background or many competing gradients.
Use navy for structure and gold as a premium accent.	Make every button, icon and chart gold.
Keep cards aligned to a consistent grid.	Mix unrelated card widths, radii and padding values.
Use real-estate imagery with consistent crop and high quality.	Use random stock images with inconsistent aspect ratios.
Create clear hierarchy between KPI, insight and detail.	Give every metric the same visual weight.
Keep animations subtle and functional.	Use excessive motion, glass blur or glowing effects.

9. Reusable AI Design Prompt

Use the following as the standard instruction whenever asking an AI coding/design tool to build a Sonthillu Constructions interface.

Create the UI using the Sonthillu Constructions Master UI Design System. The visual direction is premium, modern, airy and trustworthy, inspired by a high-end real-estate SaaS dashboard. Use the supplied Sonthillu logo as the brand reference. Use a pale blue/near-white application canvas, soft blue-gray surfaces, deep architectural navy for structure and headings, warm construction gold for brand accents, and restrained action blue for interactive/data states. Use generous spacing, consistent 8px-based rhythm, rounded cards around 14–20px, subtle borders and very soft shadows. Avoid heavy gradients, neon effects and visual clutter. Use a clean modern sans-serif such as Inter, Manrope or Plus Jakarta Sans. Maintain strong hierarchy between page titles, section titles, body text, metadata and values. Use a responsive 12-column desktop grid, collapse to 8 columns on tablet and 4 columns on mobile. The default dashboard shell should have a compact left sidebar, top utility bar, responsive main content canvas and optional contextual right rail. Build reusable components for navigation, KPI cards, charts, tables, property cards, filters, forms, status chips, notifications, modals and empty/error/loading states. The result must look like a polished production product, not a generic template. Prioritize alignment, spacing, hierarchy, consistency, accessibility and real-estate imagery. Preserve the brand identity even when the page type changes. Do not copy the reference screenshot literally; use it as the visual language and quality benchmark.

Project-specific instruction

After the master prompt, add only the project-specific requirements: page purpose, user role, data fields, workflows, permissions and business logic. Do not redefine the visual system unless there is a deliberate brand change.

10. Master Rules for Future Projects

- Treat this document as the default UI/UX baseline for Sonthillu Constructions digital products.
- The logo and brand colors are the source of truth for identity; individual project requirements are the source of truth for functionality.
- Reuse the design system, not necessarily the exact dashboard layout. A customer portal, partner portal, public website and internal tool can have different information architecture while sharing the same visual language.
- Every new project must define desktop, tablet and mobile behavior before implementation is considered complete.
- Every major component must include normal, hover, focus, loading, empty, success and error states where applicable.
- Do not sacrifice usability to imitate the visual reference. Information architecture and task completion take priority.
- Keep the interface fast and visually calm. Avoid unnecessary animations, giant shadows, excessive blur and decorative UI.
- Maintain consistent icon style, image ratios, border radius, typography and spacing throughout the application.
- Use gold strategically so it retains its premium meaning.
- Before final delivery, perform a visual QA pass for alignment, spacing, responsiveness, contrast, overflow, typography and component consistency.

FINAL STANDARD

Every Sonthillu interface should immediately feel like it belongs to the same product family: calm pale-blue canvas, architectural navy structure, warm gold identity, precise spacing, rounded modular surfaces and highly legible information.
